Making NFAs more powerful...

Context-Free Languages (CFLs)

We have seen that $\{a^nb^n \mid n \ge 0\}$ is **not regular**. (Pumping Lemma) What can we add to NFAs to enable them to recognize this language?

Derivation
Parse trees

Idea!

► Need to keep track of how many a's have been seen.

We can use a stack!

PDAs

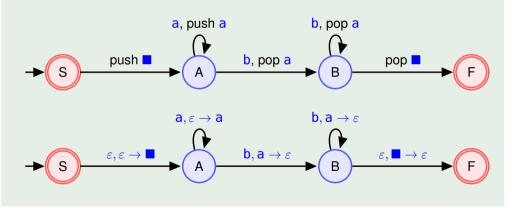

(Arbitrarily large n)

- Largely the same as NFAs but with the addition of a stack memory
 - LIFO memory (Last-In First Out).
 - Can push & pop.
 - Infinite (structured) memory!

More powerful than NFAs: can recognize some non-regular languages.

▶ On transition, the machine does not just change state: it also pushes and/or pops an item on/off the stack.

Push all the a's onto the stack, and then pop one off each time a b is read. If the stack is empty at the end then the machine accepts.

NFA & Stack

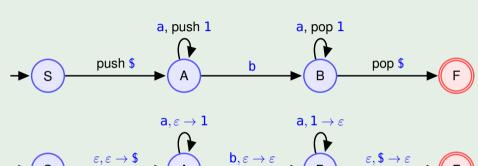

Example

Nondeterminism

Review

Generation

- We label transitions with: a, b → c
 - ▶ a: input symbol read from the input string
 - b: symbol popped off the stack
 - c: symbol which replaces it
 - ▶ Either a, b or c may be ε
- ► PDAs have no special feature for checking if the stack is empty. Counter this by pushing a delimiting character (in this case: or \$) onto the stack at the beginning, then test for this character to see if it is empty.
- ► Also there is no specific way to test for the end of the input. This is dealt with in the example by having no transitions out of the accept state (i.e. only the last character can reach it).

Generation

Nondeterminism

- Like NFAs, closed under union, concatenation, and star operations.
- Like NFAs, non-determinism, and each branch of the computation gets its own stack!
- ▶ Unlike DFAs vs NFAs, deterministic PDAs are less powerful than non-deterministic PDAs. (i.e., they recognize less languages)
- Some CFLs can only be recognized by PDAs using nondeterminism.

Example $(\{w \mid w = a^i b^j c^k \text{ where } i = j \text{ or } i = k\})$ Rewrite as:

 $\{a^{i}b^{j}c^{k} \mid i=i\} \cup \{a^{i}b^{j}c^{k} \mid i=k\}$

Context-Free

Languages (CFLs)

Push-Down Automata (PDAs)

A PDA is a 6-tuple $\{Q, \Sigma, \Gamma, \delta, q_{\text{start}}, F\}$ where

- Q is the set of states
- ► ∑ is the input alphabet
- ► Γ is the stack alphabet
- $\delta: Q \times \Sigma_{\varepsilon} \times \Gamma_{\varepsilon} \to 2^{Q \times \Gamma_{\varepsilon}}$ is the transition function
- q_{start} is the start state
- F is the set of accept states

Context-Free Languages (CFLs)

A language is Context-Free **iff** it is recognized by a non-determinsite PDA.

	Regular Languages	Context-Free Languages	
Recognizer:	NFA/DFA	PDA	
Generator:	RegEx / Regular Grammar	Context-Free Grammar	

Review

Context-Free Grammars (CFGs):

- more powerful at describing languages than RegEx's. Can be used to describe all RLs, as well as some non regular ones
- first used in the study of natural languages.

$$A \rightarrow aAb$$

 $A \rightarrow B$

 $ho \rightarrow \varepsilon$

The rules of the grammar represent possible *replacements* e.g. $A \rightarrow aAb$ means the variable A may be replaced with the string aAb.

- ► Lower case symbols a and b are terminals (like symbols for NFAs). They constitute the alphabet for the grammar.
- ► Upper case symbols A and B are variables (or non-terminals). They are to be replaced by terminals or strings.
- A is the start variable.

Generation

Derivation
Parse trees

 $A \rightarrow aAb$

 $A \rightarrow B$

 $ightarrow \varepsilon$

Commencing with the start variable, these replacements can be used iteratively to produce strings e.g.

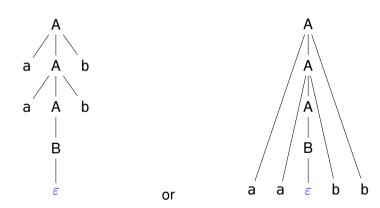

$$A
ightarrow aAb
ightarrow aaAbb
ightarrow aaBbb
ightarrow aaarepsilon bb = aabb$$

This is called a **derivation** of the string **aabb**.

Parse Trees

Diagrammatic way of representing the derivation process.

$$extbf{\textit{A}}
ightarrow extbf{\textit{a}} extbf{\textit{A}} extbf{\textit{b}}
ightarrow extbf{\textit{a}} extbf{\textit{a}} extbf{\textit{A}} extbf{\textit{b}}
ightarrow extbf{\textit{a}} extbf{\textit{a}} extbf{\textit{b}} extbf{\textit{b}}
ightarrow extbf{\textit{a}} extbf{\textit{a}} extbf{\textit{b}} extbf{\textit{b}} = extbf{\textit{a}} extbf{\textit{a}} extbf{\textit{b}} extbf{\textit{b}} = extbf{\textit{a}} extbf{\textit{a}} extbf{\textit{b}} extbf{$$

Review

Generation Derivation

- ► Make a variable R_i for each state q_i
- Add a rule $R_i \rightarrow aR_i$ for each transition from q_i to q_i on symbol a.
- ▶ Add a rule $R_i \rightarrow \varepsilon$ if q_i is an accepting state

Example

A, B $A \rightarrow 0A$ $A \rightarrow 1B$ $B \rightarrow 1B$

Generation Derivation

$$\left\{ \begin{array}{lll} A & \to & \mathsf{a} A \mathsf{b} \\ A & \to & B \\ B & \to & \varepsilon \end{array} \right. \quad \mathsf{becomes} \quad \left\{ \begin{array}{lll} A & \to & \mathsf{a} A \mathsf{b} & | & B \\ B & \to & \varepsilon \end{array} \right.$$

Here the | symbol means "or" or "union".

We have combined the first two rules into a single line.

Derivation

Design of CFGs: look for recursive structures

Example

Design a CFG to represent the language L over $\Sigma = \{a, b\}$, given by

$$L = \{ w \mid w = a^n ba^n, \quad n \ge 0 \}$$

We note that
$$a_n = \{a(a^{n-1}ba^{n-1})a \text{ for } n \ge 1 \}$$
 (Note that $a^{n-1}ba^{n-1} \in L$)

$$a^nba^n = \begin{cases} a(a^{n-1}ba^{n-1})a & \text{for } n \ge 1 \\ b & \text{for } n = 0 \end{cases}$$

CFG:

Context-Free Languages (CFLs)

Parca trace

► We call this class: **Context-Free Languages** (CFLs).

Pumping Lemma for CFLs

If L is a CFL then there is a number p where: if w is any string in L of length at least p then w may be divided into **five** pieces w = uxyzy satisfying the conditions

- 1. for each k > 0: $ux^k vz^k v \in L$
- 2. |xz| > 0
- 3. |xyz| < p

Grammar	Languages	Automaton	Production rules
Type-0	Recursively Enumerable	Turing Machine (TM)	$\alpha \to \beta$ (no restrictions)
Type-1	Context Sensitive	Linear-bounded TM	$lpha Aeta ightarrow lpha \gamma eta$
Type-2	Context Free	PDA	$A ightarrow \gamma$
Type-3	Regular	NFA	$A \rightarrow aB \mid a$

Context-Free Grammars (CFGs)

A Context Free Grammar (CFG) is a 4-tuple $\{V, \Sigma, R, S\}$ where

- V is the set of variables
- ▶ ∑ is the set of terminals
- R is the set of production rules
- ▶ S is the start variable
